"AccepTV Box : Remote HDMI" is a solution to receive an HDMI signal from anywhere, in a web browser.

Indeed, this small Linux box enables to capture an HDMI signal and stream it over the Internet, bypassing all firewalls.

On the client side, the user can view the remote HDMI signal (in a window in a web page, in an overlay floating window or in full screen).

The user can also have its own remote control displayed on screen and click on it to send infra red codes to the remote HDMI device.

Bypassing firewalls, the box connects to one of our cloud servers and streams both the video and audio signals from the HDMI signal.

"AccepTV Box: Remote HDMI" has the following advantages:

- View and hear your HDMI signal from anywhere, simply from a web browser
- Simulate your infrared remote control
- Play your video windowed mode, in overlay or in full screen
- Low latency
- Small
- Cheap
- Low-consumption
- Light-weight
